

CHERRY TOMATO

Cherry Tomato seeds can be started up to 6–8 weeks before the last spring frost date. Find your region's frost date here: www.almanac.com/content/frost-chart-united-states

START GROWING

1. Wash hands and remove all contents from kraft tube.
2. Pour bag of grow medium into tube. Don't overfill—discard excess medium.
3. Securely place paper cap back on tube, then turn tube upside down and gently shake for 10 seconds. This will create an even growing surface.
4. Remove cap and slowly add $\frac{1}{4}$ cup of water to grow medium. Pour in center of the tube and around perimeter. **Water may seep through tube, so place a coaster underneath it to prevent water damage.**
5. Sprinkle in seeds and push them $\frac{1}{2}$ " below surface of grow medium. Gently tamp the medium. Place tube in warm and sunny window (70°F).
6. Touch just below the surface of the grow medium daily, and if it's not damp, spray with a little water.

Some seeds may fail to germinate (this is nature). If sprouts don't appear in 2–3 weeks, the seeds may have been planted too deep, growing medium is too dry, or temps are too low. In dry climates, consider creating a greenhouse effect by placing the empty grow medium bag over the tube. Punch a few holes for ventilation. Remove the bag once sprouts are 2" tall.

TRANSPLANTING

Transplant once seedlings have 2–3 sets of true leaves and outside night temps stay above 55°F. You may need to repot indoors before the outdoors is ready.

You will need plant food, and if using a container, you will also need potting soil. Visit your local garden center for a healthy selection of organic offerings.

Plant in location with full sunlight. Prep your transplanting location—either container or ground—by digging a hole large enough to accommodate the plant (see details below).

Mix $\frac{1}{2}$ gallon of a mild water and nutrient solution ($\frac{1}{4}$ strength, follow nutrient's instructions). Pour solution in hole, reserving $\frac{1}{2}$ cup of solution.

Pour remaining nutrient solution into tube.

Place the tube near the bottom of the hole, and gently remove the bottom cap. Recycle cap.

Bury the seed tube so that only one set of the leaves show (yes bury a portion of the stem/leaves). Then fill in hole with soil.

Tamp the soil lightly with your hands and water the entire area to help the plant settle.

Tomatoes are heavy feeders. A phosphorus rich plant food is important for early high yields. Too much nitrogen causes rampant growth and softens fruit. As the plant grows trellising may be needed for support. Harvest fruit when ripe.

Kraft Seed Starter Kits are assembled in the USA of domestic and imported components.

Modern Sprout's Kraft Seed Starter Kits are completely biodegradable and use soy-based ink and water-based adhesive.
